Face identification for stand-alone or client-server applications

[Face liveness detection](#) is ISO 30103-7 compliant, prevents cheating with a photo in front of a camera.

**Face liveness detection.** A conventional face identification system can be tricked by placing a photo in front of the camera. VeriLook is able to prevent this kind of security breach by determining whether a face in a video stream or single frame is “live” or a photograph. The liveness detection can be performed in passive mode, when the engine evaluates certain facial features, and in active mode, when the engine evaluates user’s response to perform actions like blinking or head movements. See [recommendations for face liveness detection](#) for more details.
